2028_REC_OOPS using Java_Week 8_Q1

Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a ". " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

Input Format

The first line of input contains the email to be validated.

Output Format

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

Sample Test Case

Input: sample@gmail.com

Output: Valid email address

Answer

```
import java.util.*;  
  
class DotException extends Exception {  
    public DotException(String msg) {  
        super(msg);  
    }  
}  
  
class AtTheRateException extends Exception {  
    public AtTheRateException(String msg) {  
        super(msg);  
    }  
}  
  
class DomainException extends Exception {  
    public DomainException(String msg) {  
        super(msg);  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        String email = sc.nextLine();  
  
        try {  
            validateEmail(email);  
            System.out.println("Valid email address");  
        } catch (DotException e) {  
            System.out.println("DotException: " + e.getMessage());  
            System.out.println("Invalid email address");  
        } catch (AtTheRateException e) {  
            System.out.println("AtTheRateException: " + e.getMessage());  
            System.out.println("Invalid email address");  
        }  
    }  
}
```

```
        System.out.println("AtTheRateException: " + e.getMessage());
        System.out.println("Invalid email address");
    } catch (DomainException e) {
        System.out.println("DomainException: " + e.getMessage());
        System.out.println("Invalid email address");
    }
}

public static void validateEmail(String email) throws DotException,
AtTheRateException, DomainException {
    if (email.startsWith(".") || email.endsWith(".")) {
        throw new DotException("Invalid Dot usage");
    }

    int atCount = email.length() - email.replace("@", "").length();
    if (atCount != 1) {
        throw new AtTheRateException("Invalid @ usage");
    }

    String[] parts = email.split("@");
    if (parts.length != 2 || parts[0].isEmpty() || parts[1].isEmpty()) {
        throw new AtTheRateException("Invalid @ usage");
    }

    String domainPart = parts[1];
    if (!domainPart.contains(".")) {
        throw new DotException("Invalid Dot usage");
    }

    if (domainPart.endsWith(".")) {
        throw new DotException("Invalid Dot usage");
    }

    String[] domainSplit = domainPart.split("\\.");
    String extension = domainSplit[domainSplit.length - 1];
    List<String> validDomains = Arrays.asList("in", "com", "net", "biz");

    if (!validDomains.contains(extension)) {
        throw new DomainException("Invalid Domain");
    }
}
```

Status : Correct
